Control reproducibility

The most common form of randomness used in neural networks is the random initialization of the network weights. Although randomness can be used in other areas, here is just a short list:

- Randomness in Initialization, such as weights.

- Randomness in Regularization, such as dropout.
- Randomness in Layers, such as word embedding.
- Randomness in Optimization, such as stochastic optimization.

source: https://machinelearningmastery.com/reproducible-results-neural-networks-keras/

```
import random
np.random.seed(42)
random.seed(42)
for computing_unit in ctx:
    mx.random.seed(42, ctx = computing_unit)
tf.random.set_seed(42)
```

2. Read dataset - General Train/Test split

```
def read_mnist(images_path: str, labels_path: str):
    #mnist_path = "data/mnist/"
    #images_path = mnist_path + images_path
    folder = os.getcwd() + "/notebooks/"
    print(images_path)
    with gzip.open(folder + labels_path, 'rb') as labelsFile:
        labels = np.frombuffer(labelsFile.read(), dtype=np.uint8, offset=8)

    with gzip.open(folder + images_path,'rb') as imagesFile:
        length = len(labels)
        # Load flat 28x28 px images (784 px), and convert them to 28x28 px
        features = np.frombuffer(imagesFile.read(), dtype=np.uint8, offset=16) \
                        .reshape(length, 784) \
                        .reshape(length, 28, 28, 1)
    return features, labels

# upload the 4 data file in the same folder of notebooks on your drive and check that they are
# lested below
os.listdir(os.getcwd() + "/notebooks")
```
